MiniBull Gold vs Indices Bot (cTrader)

An automated cBot trading Gold vs. NAS100/S&P500;/US30 divergences.

Bot monitors GOLD, NASDAQ100, S&P500;, and US30 together, watching for moments when three of the four move one direction while one lags behind — a potential "fake move." A trade triggers only when the Daily trend permits it, a Gold-ratio has stretched then started reversing, and the lagging instrument's MA deviation is shrinking. Entries use closed-bar data only — no repainting.

Risk is ATR-based throughout: stop-loss, take-profit, trailing stop, and break-even scale with each instrument's Daily ATR. A Max Hold limit closes stale trades after N daily bars. An optional Auto Trend Filter reads Gold's Weekly trend and favors the dominant direction, cutting exposure when reversals weaken in trending markets.

Backtested across brokers and regimes, including the 2022 bear market, 2023 banking crisis, and 2025 tariff shock — drawdowns stayed contained, though results varied. Fully functional: trades live and demo accounts. Backtest first — past results don't guarantee future performance.
